

# Windows Server 2016 Lab: Managing Services and Storage

This hands-on lab simulates a real-world junior system administrator scenario using one Windows Server 2016 virtual machine and one Windows 10 client virtual machine.

## Lab Environment

- SERVER01 – Windows Server 2016
- CLIENT01 – Windows 10 (Domain Joined)

## Lab Objectives

- Add and manage server storage
- Configure file sharing and permissions
- Manage and troubleshoot Windows services
- Apply quotas and monitor system events

## Part 1: Server Preparation

- Rename server to SERVER01
- Restart server after rename

## Part 2: Storage Management

- Add a new virtual disk (20–30 GB)
- Initialize disk as GPT
- Create NTFS volume with drive letter S:
- Label volume as CompanyData

## Part 3: File Sharing and Permissions

- Create folders: HR, IT, Public
- Share CompanyData folder

- Configure NTFS permissions following least privilege principle

## **Part 4: Service Management**

- Open services.msc
- Configure Windows Update to Automatic (Delayed Start)
- Stop and restart Print Spooler to simulate failure

## **Part 5: Storage Quotas**

- Install File Server Resource Manager (FSRM)
- Apply 5 GB hard quota to Public folder

## **Part 6: Client Testing**

- Access \\SERVER01\CompanyData from Windows 10
- Verify access restrictions and quota enforcement

## **Part 7: Monitoring**

- Use Event Viewer to review service logs
- Identify service start and stop events

## **Skills Gained**

- Windows Server storage expansion
- Service configuration and troubleshooting
- File server security
- Enterprise-style system administration
